

Short communication

***Camponotidea fieberi* Reuter, 1879 (Hemiptera: Miridae),
a genus and species new for the Island of Crete**

Abstract. The genus *Camponotidea* Reuter, 1879 with *C. fieberi*, Reuter, 1879 (Hemiptera: Miridae) is recorded for the first time from the Island of Crete. Differences between *C. fieberi* and *C. saundersi* (Puton, 1874) are discussed. A new host plant is presented for this Ponto-Mediterranean zoophytophagous species.

Key words: Heteroptera, true bugs, new record, faunistics, distribution, Island of Crete, Greece.

The genus *Camponotidea* Reuter, 1879 takes its name from the similarity of its brachypterous specimens with ants of the genus *Camponotus* Mayr. *Myrmecoris saundersi* Puton, 1874 from Izmir (Turkey), was initially designated as type-species. The revision by Hoherlandt & Jordan (1944) confirmed that it contains two taxa, *Camponotidea fieberi* Reuter, 1879 and *C. saundersi* (Puton, 1874).

The recent checklist of the Heteroptera of the Island Crete (Heckmann *et al.*, 2015) contains 151 taxa of Miridae, but no species of the genus *Camponotidea* was ever collected or photographed.

In this paper, we present the photographic material relating to *C. fieberi*, which is new to the island of Crete and discuss differences between *C. fieberi* and *C. saundersi* with some new bio-ecological data.

Materials examined (Figs 1–2). GREECE: Island of Crete, Chania, prefecture, Sfakia region, Askyfou plateau, altitude 750 meters, 35°17'22.35"N 24°10'57.28"E, 15. VI.2020 1 ex. on *Scolymus hispanicus* (L.) (Asteraceae).

Distribution, European Turkey, Greece. Asia: Turkey, Iran, Iraq, Israel? (Aukema & Rieger, 1999; Linnauvori, 2009; Ghahari & Chérot, 2014). **Genus and species new to the Island of Crete.**

Comparative notes. *Camponotidea fieberi* (Figs 1–2) is very similar to the Mediterranean *C. saundersi* (Puton, 1874) (Figs 3–4), but both can be separated according to the following characters: ***Camponotidea fieberi*** (Fig. 5). Labium reaching anterior coxae, third antennal segment 0.5 times the second, apex of hemelytra, in brachypterous specimens, with a wider cres-

cent-shaped pale area; ***C. saundersi*** (Fig. 6) Labium reaching median coxae, third antennal article 0.6–0.7 times the second, apex of hemelytra, in brachypterous specimens, with a thin pale horizontal line away from the posterior border.

Figs 1–4. 1–2. *Camponotidea fieberi* from Crete 1. on a flower of *Scolymus hispanicus* (photo F. Samaritakis), 2. sucking the stem of *Scolymus hispanicus*. 3–4. *Camponotidea saundersi* from Apulia. 3. on *Teucrium capitatum* L. ssp. *capitatum* (L.) (photo G. C. Pasquali), 4. on *Onobrychis caput-galli* (L.) Lam (photo G. C. Pasquali).

Figs 5–6. The apical white/yellow spots on the hemelytra. 5. *Camponotidea fieberi* (Turkey), 6. *C. saundersi* (Italy) (photos P. Dioli).

Remarks on biology

Camponotidea fieberi is a zoophytophagous species, but its detailed biology is little known. Its behaviour as a predator seems to be generalistic since, in Ukraine, its myrmecophagy was recently documented (Çerçi, 2019), and in Crete, *Scolymus hispanicus* (L.) (Asteraceae) was in the present paper recorded as its new host plant (Figs 1–2). Seidenstücker (1959) reported it as numerous on *Salvia horminum* (L.) (Lamiaceae) in Turkey, in the cultural area on paths, railway embankments, and meadow edges; several specimens were also caught on *Vicia* sp. often streaked with herbaceous vegetation, but never together with ants.

Acknowledgements

We thank the botanist and photo-naturalist Gian Carlo Pasquali (Taranto) for helpful communication about host plants and his photos of *C. saundersi*. Our profound thanks also goes to our colleagues, namely Federic Chérot (Département de l'Etude du Milieu Naturel et Agricole, Service Public de Wallonie, Gembloux, Belgium) and Hassan Ghahari (Department of Plant Protection, Islamic Azad University, Tehran, Iran) for useful suggestion and revision of the manuscript.
